Alopex Network Inc.
Information Security Policy

To ensure that our Information Security Management System (ISMS) is fully implemented, operates effectively, is properly supervised and continuously maintained, and to protect the confidentiality, integrity and availability of our critical information systems, the company hereby issues this Information Security Policy.

This policy gives every employee a clear guiding principle in their daily work. All employees are obligated to actively support it, so that our people, data, information systems, equipment and networks are operated securely. We expect every employee to understand, implement and maintain it to achieve continuous business operation.

1. Implement security, strengthen service quality

All employees shall carry out the ISMS. Every information-related measure shall ensure the confidentiality, integrity and availability of business data, protecting it from leakage, damage or loss caused by external threats or improper internal management. Appropriate safeguards are selected to reduce risk to an acceptable level, and the ISMS is continuously monitored, reviewed and audited to strengthen service quality.

2. Strengthen training, reduce security risk

We ensure all employees carry out their security responsibilities and receive appropriate security training every year, building the principle that security is everyone's responsibility. This raises awareness of its importance, encourages compliance with security rules, improves incident-response capability and reduces risk.

3. Prepare for emergencies, ensure business continuity

We maintain emergency response and disaster recovery plans for critical information assets and key business functions, and regularly exercise key business processes, so that when systems fail or a major disaster occurs we can recover quickly, keep critical operations running and minimize losses.
